The group of this partnership project includes professionals such as teachers, researchers and technical personal belonging to all the institutions involved, as well as student/trainees attending ICT and E-working courses in the involved and/or a nearby institutions, so that our partnership deals not only with pedagogical issues, but also with learner active engagement and involvement.

Teachers, researchers and technical personal are working together eagerly in planning, implementing and assessing the project activities, but it is essential for the successful implementation of this project that also the students participate actively in it, as we have already anticipated above, given that they give us the key information of their needs and fears about ICT learning. They hopefully produce some contents for project website as a reflection of their interests and motivations, too.

Visits will are being organised for both professionals and students/trainees and all of them participate in the meetings. Student exchanges enable them to reach common topics of interests in ICT and E-working learning and to produce contents of the project website. In short, an active involvement among all participants (teachers, researchers and students/trainees) is guaranteed by mobility activities and the use and implementation of a virtual platform.

This exchange is being multidirectional both in time and in space: continuous contact enabled by ICT tools, among all the institutions and among all participants in common and specified forums (professional to professional, senior to senior, or professional to senior). As previously told, and to summarise, in order to achieve the aim of this project, ICT-based working and regular meetings is being combined.
